Sequence 1521, Application US/09134001C

Patent No. 6380370

GENERAL INFORMATION:
APPLICANT: Lynn Doucette-Stamm et al
APPLICANT: Lynn Doucette-Stamm et al
APPLICANT: Lynn Doucette-Stamm et al
ITILE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS
ITILE OF INVENTION: UNUCLEIC ACID AND THERAPEUTICS
FILE REFERENCE: GTC-007

CURRENT APPLICATION NUMBER: US/09/134,001C

CURRENT FILING DATE: 1998-08-13

PRIOR APPLICATION NUMBER: US 60/064,964

PRIOR FILING DATE: 1997-11-08

PRIOR FILING DATE: 1997-08-14

NUMBER OF SEQ ID NOS: 5674

SEQ ID NO 1521

LENGTH: 477

TYPE: DNA
ORGANISM: Staphylococcus epidermidis

An Arabidopsis full-length cDNA library was constructed essentially as reported previously (Seki et al., 1998).cDNA cleaved with BamHI and XhoI was ligated to modified Lambda FLC-1 vector (Carninci et al., submitted for publication) digested with BamHI and SalI. This clone is in a modified pBluescript vector. Please visit our web site (http://www.gsc.riken.go.jp/e/plant/index _e.html) for further
                                                                                                                                                                                                                                                                                   RIKEN Genomic Sciences Center

Set 2 were grown under the standard conditions and then were water stressed by withdrawal of further watering applications. Drought stressed plants were harvested after cessation of watering (leaves: 3d, 5d, and 7d; roots: 3d and 5d). Set 3 were grown under the standard conditions and then were cold stressed by placement at 4 C. Cold stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d, and 4d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d, 2d. Set 4 were grown under the standard conditions and then were heat stressed by placement at 35 C. Heat stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d, 2d and 4d and heat-stressed roots were harvested at 3 hr, 6 hr, 12 hr, 1 d, and 4d and heat-stressed roots were harvested at 5 hr, 6 hr, 12 hr, 1 d, and 4d. RNA was isolated from all tissues and equal RNA from each tissue and stress was pooled to construct the CDNA library. RNA sample."

/note="Organ: Fruit; Vector: pTriplEX2; Site 1: SfiIA;
Site_2: SfiIB; Developing citrus fruits were Tharvested
from trees growing in the 'Citrus variety collection' in
the Wolfskill experimental orchard located in Winters,
California (USA). Fruit was collected on October 22, 2003,
between 8 to 9 am and stored at 4C. The flavedo tissue was
dissected out of developing fruit (165 DAFB) and used to
isolate RNA using Trizol reagent from Invitrogen. The cONA
Library was constructed using the SMART cDNA library Kit
(Clontech). The primary library was en masse evicted and
plasmid DNA containing the cDNA library was then
transformed into ultra competent B coli cells (XL10 Gold;
Stratagene). Transformants were plated out on Q-trays
(2000 cfu/tray), picked using a Obot and archived in 384
well dishes "

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TTAGAAATTCCCCCAAAACAATATATCAA
                                                                                         four separate sets of plants. Set 1 involved saturation of the soil with 150 mM NaCl and tissues were harvested at following application of the salt stress (leaves: 2hr, 6hr, 12hr, 1d, 2d, and 4d; roots:2hr, 6hr, 12hr, and 2d). Set 2 were grown under the standard conditions and then were water stressed by withdrawal of further watering applications. Drought stressed plants were harvested after cessation of watering (leaves: 3d, 5d, and 7d; roots:3d and 5d). Set 3 were grown under the standard conditions and then were cold stressed by placement at 4 C. Cold stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d, and 4d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d, 2d and 4d and heat stressed by placement at 35 C. Heat stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d, 2d and 4d and heat stressed roots were harvested at 5 hr, 6 hr, 12 hr, 1 d, 2d and 4d and heat stressed roots were harvested at 5 hr, 6 hr, 12 hr, 1 d, 2d and 4d and heat stressed roots were harvested at 6 hr, 12 hr, 1 d, and 4d. RNA was isolated from all tissues and stress was not of the stress and stress was not determined.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /lab host="blius-lum / lobor | library" / clone libe potato abiotic stress cDNA library" / clone libe potato abiotic stress cDNA library" / note="Vector: pCMVSport6.1; Site 1: EcoRI; Site 2: NotI; / note="Vector: pCMVSport6.1; Site 1: EcoRI; Site 2: NotI; supplier: Solanum tuberosum var. Kennebec plants were grown from cuttings on a 16hr light/8 hr dark cycle at 25 grown from cuttings on a 16hr light/8 hr dark cycle at 25 grown from stress conditions were applied to C for 3-4 weeks. Abiotic stress conditions were applied to C for 3-4 weeks. Abiotic stress conditions were applied to C for 3-4 weeks.
                               equal RNA from each tissue and stress was pooled to construct the cDNA library. RNA sample."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           C for 3-4 weeks. Abiotic stress conditions were applied to four separate sets of plants. Set 1 involved saturation of the soil with 150 mM NaCl and tissues were harvested at following application of the salt stress (leaves: 2hr, 6hr, 12hr, 1d, 2d, and 4d; roots:2hr, 6hr, 12hr, and 2d). Set 2 were grown under the standard conditions and then were water stressed by withdrawal of further watering applications. Drought stressed plants were harvested after cessation of watering (leaves: 3d, 3d, 3d, 7d, roots:3d and 5d). Set 3 were grown under the standard conditions and then were cold stressed by placement at 4 C. Cold stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d, and 4d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d, 2d. Set 4 were grown under the standard conditions and then were heat stressed by placement at 35 C. Heat stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d, 2d and 4d and heat-stressed roots were harvested at 2 hr, 6 hr, 12 hr, 1 d, 2d and 4d and heat-stressed roots were harvested at 6 hr, 12 hr, 1 d, 2d and 4d and heat-stressed roots were harvested at 6 hr, 12 hr, 1 d, 2d and 4d and 4d. RNA was isolated from all tissues and construct the CDNA library. RNA sample."

/note="Site_1: XhoI; Site_2: EcoRI; mRNA were extracted from field grown plants (Dunkerque, France). Following harvest, roots, leaves and flowers were cut-off and discarded, as were the bottom 10 cm of the stem. The following bottom 15-cm section of the stem was then isolated and the outer fiber-bearing tissues peeled off and immediately frozen in liquid nitrogen. Library was constructed using ZAP-cDNA synthesis kit and ZAP-cDNA Gigapack III cloning kit (Stratagene)."

//note="Organ: Apical meristem and tissues surrounding of immature plants; Vector: pSportl; Site 1: SalI; Site 2: NotI; An unidirectional cDNA library generated from [Apical meristem and tissues surrounding of immature plants]. cDNA was prepared from polyA+ mRNA using SuperScript Plasmid System Kit (Invitrogen). The double-strand cDNAs were fractionated in a sepharose CL-2B 40cm-columns and fragments sizing between 0.8 and 1.5 Kb were directionally cloned into the vector. Details of each source of RNA and library construction can be obtained at http://sucest.lad.ic.unicamp.br/public"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /mol_type="mRNA"
